

ABSTRACT

In the case of searching for a search object
400, measuring terminals 300 obtain information about
an area where the search is effected from a request
5 terminal 100 requesting the search, and a service
device 200 calculates the position information of the
search object 400 for the terminal 100 on the basis
of present position information and distance
information given from the measuring terminals 300.
